

ABSTRACT OF THE DISCLOSURE

A condom for simulating conditions arising during the first sexual intercourse of a virgin woman, wherein a red fluid is released to simulate bleeding. The condom has a flexible sheath having an open end and a closed end. A closed compartment containing a red colored fluid simulating blood is disposed at the closed end. The closed compartment is fabricated from a material weaker than that of the sheath. The closed end of the sheath is preferably formed at an acute angle to the longitudinal axis of the sheath, with the closed compartment disposed forwardly and partially to the side of the front end of the sheath. Optionally, the closed compartment also contains a sponge material tending to retain some of the fluid even after rupture of the closed compartment. Preferably, the sheath and closed compartment are dark or opaque, so as to conceal the red fluid. In a further option, indicia circumscribing the sheath between the closed and open ends is provided, to indicate a suitable location for cutting the sheath, thereby converting the condom to a female repository.
